Assignment: Building a Blogging Website

Objective: Create a blogging website with a landing page, post detail page, and authentication system while emphasizing the use of array methods and the fetch() method for HTTP requests.

Requirements:

1. Landing Page

- Create a landing page with a navigation bar at the top.
- The navigation bar should display the page name on the left and a "Login" button on the right for users who are not logged in.
- If a user is logged in, display a "Logout" button instead of the "Login" button.
- Render the last 20 posts on the landing page using JavaScript array methods such as map(), filter(), or slice().
- Use the fetch() method to retrieve the post data from a JSON file (or an API if available).

2. Authentication System

- Implement a simple authentication system where users can log in and log out.
- Use the localStorage API to store the user's authentication token.
- When a user logs in, make an HTTP request to validate the user's credentials using the fetch() method.

3. Post Detail Page

- Create a post detail page where users can view the full content of a post.
- Users should have the option to edit or delete the post.
- If a user chooses to delete a post, show an "Are you sure?" confirmation alert box. If they confirm, delete the post using array methods and make an HTTP request to update your local json.
- If a user chooses to edit a post, use array methods to update the post data and make an HTTP request to update your local json.

4. Create a Post Page

- Implement a "Create a Post" page where logged-in users can create new posts.
- Users should be able to enter a title, content, and other necessary information for a new post.
- After creating a post, use array methods to add the new post to the list of posts on the landing page and make an HTTP request to update your local json.

5. Design and Styling

- Apply CSS styling to make the website visually appealing.
- Ensure that the website is responsive and looks good on both desktop and mobile devices.

Additional Guidelines:

- Use JavaScript array methods like map(), filter(), find(), etc., wherever appropriate to manipulate data.
- Utilize the fetch() method for making HTTP requests to retrieve, create, update, or delete posts.
- Handle errors gracefully when making HTTP requests.
- Include proper comments and documentation in your code to explain your use of array methods and the fetch() method.

Submission:

- Submit a ZIP file containing your HTML, CSS, and JavaScript files.
- Include a README file explaining how to run your application, any additional information about your project, and how you used array methods and the fetch() method.
